SOFTWARE FOR METAL AM SIMULATION

perfectly printed

Simufact Additive is a process solution to get parts first time right.

Distortion of parts during the printing and manufacturing process is a major impediment to companies not realizing the full benefits of the additive manufacturing process. An enormous amount of unproductive time and cost spent on trial and error. Simufact Additive is a solution aimed at predicting and resolving distortion during the entire print, HIP and cutting process - before sending a part to the machine.

Typical challenges in Metal Additive Manufacturing

Challenge from a business point of view:

- High hourly machine costs (due to machine acquisition and power costs)
- Machine availability: Experimental testing on the machines reduces the productiveness
- Relatively high material costs

Challenges from a technical point of view:

There are various influencing factors in the additive manufacturing process with different significance, such as

- Different production methods and their special physics
- Different 3D printers and their machine-specific influence on the production process
- Differing metal powder quality

A very high number of machine input parameters (up to 200) is involved in AM processes, all having an impact on the achieved behavior of the final parts. Prior to producing the parts, you have to answer questions like

- What is the best support structure strategy in terms of location and properties?
- What is the best build-up orientation?

Complex physical interactions cause an inconsistent quality of the produced parts.

Non-optimal part design for manufacturing leads to

- Incorrect produced or even failed parts (cracks), due to
 - ... Distortion
 - ... Residual stress

How Simufact Additive can help you solve these issues

Simufact Additive is a powerful and scalable software solution for the simulation of metal-based additive manufacturing processes.

Simufact Additive helps you produce **AM parts first-time-right**:

- Calculate the deformation of the final part and reduce / avoid distortion
- Minimize residual stress
- Optimize the build-up orientation
- Optimize the support structure
- Condition the part also after heat treatment, base plate and support structure removal

In the future also

- Predict the microstructure
- Indicate criteria-based part failure

With its initial release, Simufact Additive puts its focus on **Powder Bed Fusion processes** including Selective Laser Melting (SLM), Direct Metal Laser Sintering (DMLS), LaserCUSING®, Electron Beam Melting (EBM), and more. Deposition processes are currently covered by Simufact.welding.

The macroscopic approach enables simulation results in minutes providing an accurate prediction of distortion and stress.
